Installing OpenShift Enterprise multi-nodes config using VirtualBox for extended demos

Gabriel Bechara

Principal Solution Architect @ Red Hat

https://github.com/gbechara/osedevops

Prerequisites

- Virtual Box (tested on Version 5.0.20 r106931)
- Vagrant (tested on 1.8.1)
- Valid RHEL7 & OpenShift Container Platform Subscription
 - Trials are available on https://www.openshift.com/container-platform/trial.html
- Create your own Vagrant Box
 - Create a VirtualBox with RHEL7 "Server"
 - Add to this VirtualBox your valid Subs or use vagrant-registration plugin
 - Convert this Box into a Vagrant Base Box located on your local disk
 Instruction are here https://www.vagrantup.com/docs/boxes/base.html
 name this base box rhel72-server-base.box (or change the name in the Vagrantfile)
 do not share this box: it contains your subscriptions

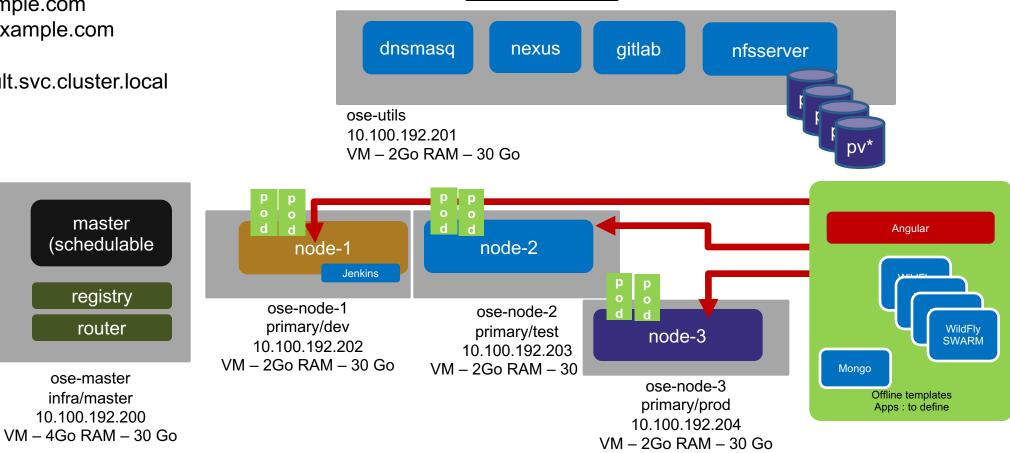

Architecture

DNS entry for each VM

ose-master.example.com ose-utils.example.com ose-node-1.example.com

Wildcards

*.router.default.svc.cluster.local

Deskton – ose client

Desktop - ose client Windows & Mac

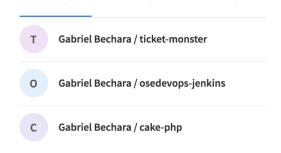

Usage (1/2)

nameserver 10.100.192.201

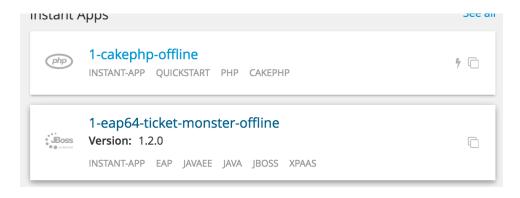

Get the souce code > git clone https://github.com/gbechara/osedevops.git If your Sub is not in the Vagrant box you can use the vagrant-registration plugin add in ~/.vagrant.d/Vagrantfile or in the Vagrantfile you got form github the following Vagrant.configure('2') do |config| config.registration.username = '<your Red Hat username>' config.registration.password = '<your Red Hat password>' config.registration.pools = ['thepoolthatcontailnstheadequatesubs'] End Launch > Change the passwords in the file Vagrantfile to match the root password of your box This password is needed to copy the generated ssh key to all OpenShift nodes > cd osedevops > vagrant plugin install vagrant-cachier > vagrant plugin install vagrant-registration (if your sub is not in the vbox) > vagrant up configure your host to add a dnsserver on linux add in /etc/resolv.conf search example.com 10.100.192.201 on osx create 2 files named 'example.com' and 'router.default.svc.cluster.local' in /etc/resolver add to those files

Usage (2/2)

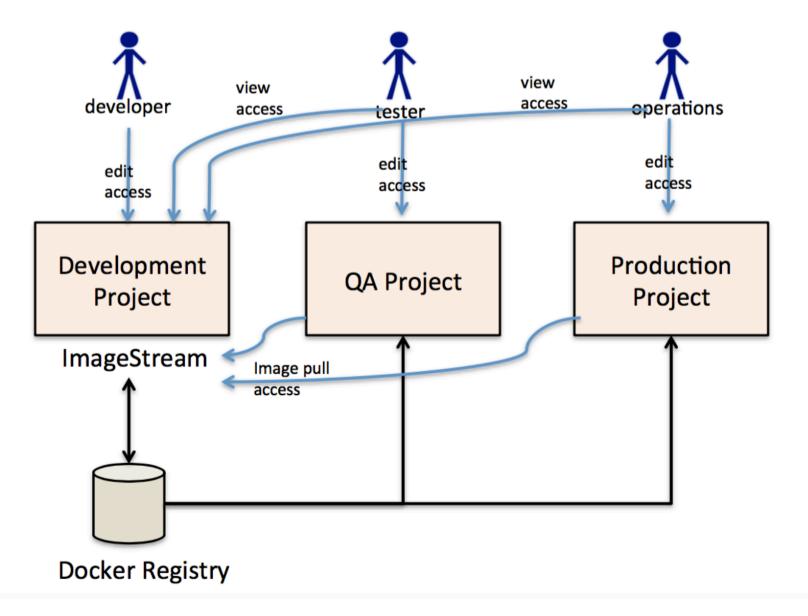

- Openshift Web Console
 - https://ose-master.example.com:8443/console/
 - User dev1/dev1 have access to the development project
 - User test1/test1 have access to development, testing, ci and production (when created) project
- Jenkins
 - https://jenkins-ci.router.default.svc.cluster.local/
 - Jenkins user is system/password
 - Use pipeline-development-ticket-monster/
- GitLab
 - http://gitlab.example.com/
 - User gabriel/weareawesome
 - 2 projects used by offline templates and one for jenkins

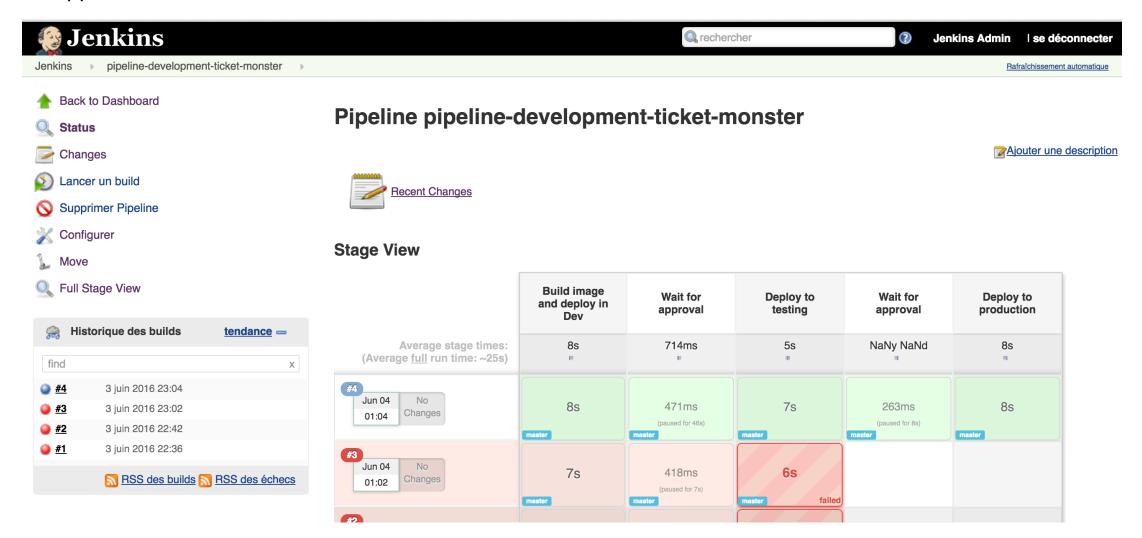

Example

Jenkins Pipeline: from dev to production

→ Approvals between environments and creation of the next env if it does not exist

Notes

- Installation works only when connected to internet
 - OOTB Templates use github and maven repos
 - I may take time, around 40 minutes, depending on the roles you add
- 2 templates can then be used to do offline demos
 - 1-eap64-ticket-monster-offline
 - 1-cakephp-offline
- During the install the sample gitlab, nexus, the docker images, the jenkins plugins are all populated to work offline for the 2 templates
- 3 users (gabriel, dev1, test1), 2 projects (development, testing) are created to deploy the sample, the jenkins job "pipeline-development-ticket-monster" will create a third project

Roadmap

- ✓ Add NFS for persistent Volumes
- ✓ Add a git server
- ✓ Add a nexus
- ✓ Add templates for offline demos using the git server and the nexus
- ✓ Deploy and example to populate the docker registry, gitlab and nexus
- ✓ Showcase an application promotion across environments
- ✓ Showcase Jenkins with approval steps
- Add other samples
 - Deploying WildFly SWARM microservices on OpenShift
 - Covering the entire DevOps lifecycle
 - Other ideas ?
 -
